Gundagai Sewage Treatment Plant

1.0 Background

Gundagai Sewerage system was constructed during 1930s. The sewerage systems consists of reticulation sewers, sewage pump stations and rising mains and a sewage treatment plant. The existing sewage treatment plant has passed its useful life and a contract has been let to construct a new sewage treatment plant to replace the existing sewage treatment plant and part of the existing sewerage infrastructure.

The existing treatment plant consist inlet works, Imhoff tank and trickling filters, humus tank, maturation pond and sludge digester. Digested sludge is discharged into drying beds and disposed at landfill sites. Treated effluent is used to irrigate parks, sporting fields and golf course.

Figure 1- Layout of Gundagai Sewage Treatment Plant

At present a new Sewage Treatment Plant is under construction with Intermittently Decanted Extended Aeration (IDEA) with sludge dewatering facilities. Upon completion of testing and commissioning of the new treatment plant which is designed to produce higher quality treated effluent for irrigation reuse.

The new plant will have screens, grit removal IDEA process with sludge dewatering facilities. The treated effluent will be disinfected with UV light unit prior to using it for irrigation of parks, garden, sporting fields and golf course. Treated Effluent will be discharged into the nearby waterways while there is not irrigation demand.

2.0 Water Quality Monitoring

2.1 Water Quality Monitoring Locations

Sampling and testing of the Treated effluent is done at fortnightly interval at three locations which include;

- Maturation pond outlet
- Inlet to the irrigation pond
- Outlet to the irrigation pond

The location of sampling points are shown in figure 2.

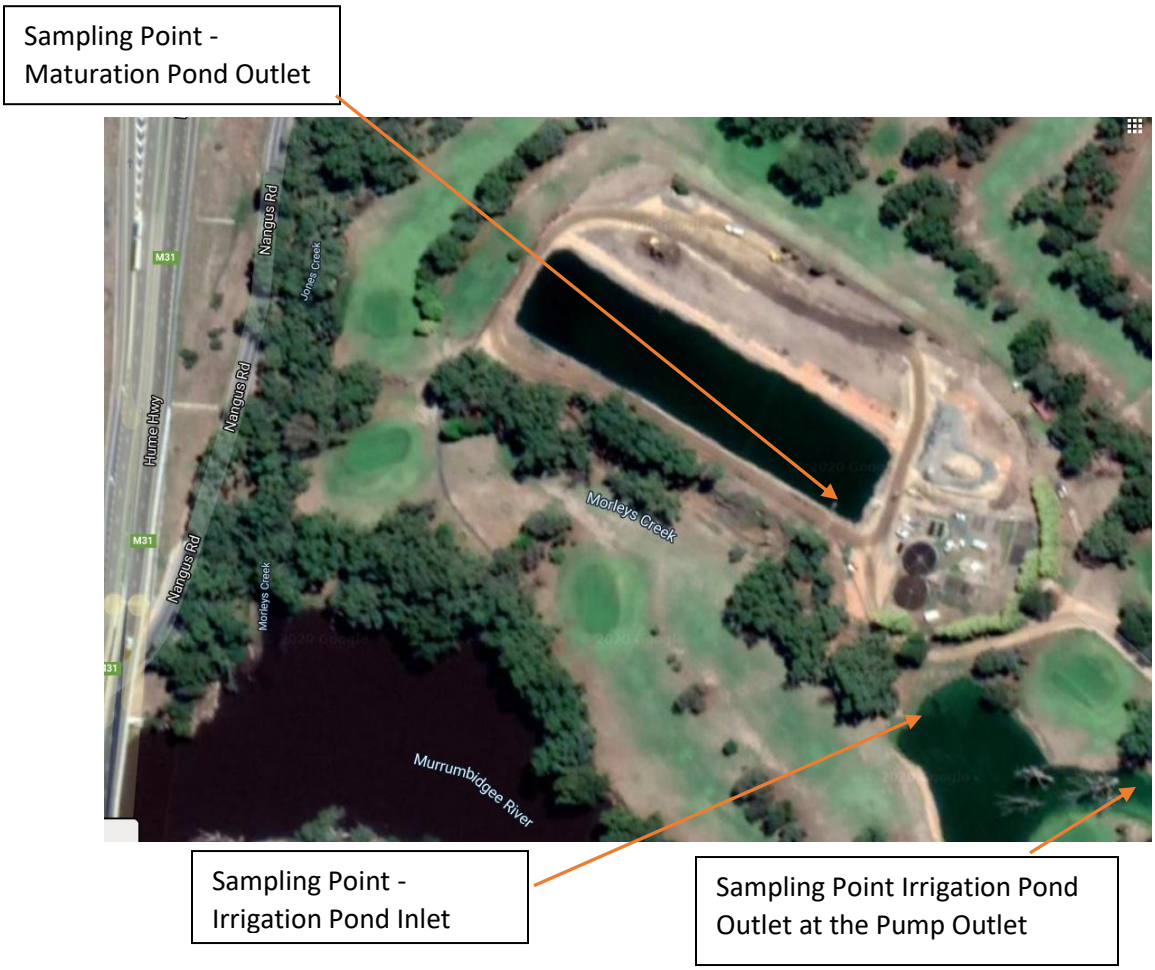

Figure 2- Location of Sampling Points

2.1 Water quality monitoring and reporting

Water samples are collected and dispatched for testing at NATA accredited laboratories and the test results are provided in Section 3 of this report.

Subsequent to a Risk Management Study on the treated effluent reuse facilities, it was proposed to install a disinfection unit based using sodium hypochlorite solution to reduce the coliform count on the irrigation water and to fully comply with License Requirements.

A skid Chlorinator using 12.5% hypochlorite solution was installed, tested and commissioned on 28 August 2020. Subsequent to this the coliform count in the irrigation point has dropped significantly representing an LRV of 3 and above achieved by the disinfection process. Further details can be found in the water quality report in Section 3 of this report.
